

# Michiel Bertus de Jong

21/07/1975, The Netherlands

<https://michieltbdejong.com>

michielt@unhosted.org

*Deep understanding of internet technology and server scalability.  
Critical thinker. Many years of experience developing decentralized,  
peer-to-peer and scalable solutions to complex problems.*

## Scalability, High Performance and Hosting

**Tuenti** (Apr 2009 - Feb 2011) Lead of the "backend for core" agile team, using advanced scalability techniques to make the tuenti.com website reliable and fast on its 1000 servers. While leading the images team, I was responsible for a self-healing Distributed Hash Table containing over a billion photos. We wrote most code in PHP. Data was sharded across MySQL clusters with large Memcache farms in front.

**IndieHosters** (Oct 2014 - Jun 2015) Docker-based hosting for end-users, with the aim to help decentralize the web. Our two-man project made it onto the frontpage of Wired.com.

**Kibitech**

**Kibitech** (Oct 2008 - Apr 2009) I was the director of the C++ development department, and in charge of a team of eight engineers. My work consisted of the development of a system of TV2.0 in dedicated hardware. Our in-house viewer was the world's best at streaming video with SVG animations.

**By TechDesign** (Apr 2007 - Sep 2008) Person in charge of all in-house software development, related to physical security in banks (time-delayed safes, access control, ATMs, fingerprint readers, license plate scanners). Using embedded microprocessors and developing algorithms that work in real time with hardware. We developed mostly in C#.

**TEVA, S.A.** (Nov 2005 - Apr 2007) Responsible for the development and production of all high tech products (traffic cameras, license plate readers, etc.). I mainly wrote in C/C++.

**Hostway Ltd.** (Nov 2002 - Nov 2005) Engineer and senior architect of Web servers and server clusters. Promoted main engineer in linux, and one of the 3 main engineers in Windows. I was responsible to maintain 200 linux servers and 100 virtual private servers, that contain 5,000 Web sites and support the email for 10,000 companies. All automation was done entirely with Python scripts.

# Open Source and Internet Revolution

**Ripple** (Feb 2017 - Nov 2018) Helped define and implement the [Interledger](#) protocol for the Internet of Value. We had many detailed discussions about the protocol specs and I took up product and release management of the research team's flagship product, ILP-KIT (NodeJS).

**Mozilla** (Aug 2015 - Jul 2016) Data sync for Firefox OS. Our agile team implemented a server in Python (Pyramid framework), and a client in JavaScript. The goal was to synchronize bookmarks, photos, contacts, etc. in a decentralized way.

**Unhosted** (Sep 2010 - Sep 2014) Wrote the "[Unhosted Web Apps](#)" book, led the [remoteStorage Internet Draft](#) at IETF, and the [remotestorage.js library](#). Highly visible in the web tech community, and awarded several funding grants.

**LedgerLoops** (Oct 2016 - Dec 2018) LedgerLoops is an alternative to money, based around a novel concept: cryptographically triggered IOUs. The website ([ledgerloops.com](#)) introduces the "Whispering Merchants" problem as an abstraction of trade flows in the real world. It explains how LedgerLoops is a more decentralized solution than money, requiring everybody only to trust their immediate economic neighbors. The whitepaper defines the LedgerLoops protocol, and an implementation in Node.js is currently in the making.

**Terms of Service; Didn't Read** (Aug 2011 - present) Rating the terms of service we all agree to by checking a box when signing up for a web service, but which hardly anybody ever reads. I was interviewed about ToS;DR on National Public Radio (NPR) in the US and our project was featured in quality newspapers like Frankfurter Allgemeine (DE) and Le Monde (FR).

# Computer Science and Artificial Intelligence

**CWI Institute (Amsterdam)** (1999 - 2001) PhD research (A.I.)

**Oxford University (Oxford, England)** (1998 - 1999) R&D engineer

**Leiden University** (1994 - 1998) MSc degree (Computer Science)

Over the past 25 years, my favourite programming language has slowly shifted across Pascal/Delphi, C/C++/C#, Java, PHP, Python, Ruby, JavaScript, and Go. Having lived abroad and nomadically, I also learned to speak Dutch, English, Spanish, German, French, some Indonesian, and a little bit of sign language. I now live in Utrecht, and in my spare time I love playing Chopin on the piano, squash with friends, or peekaboo with our one-year-old son!
